## Secondary Containment Equipment Pads

**LOCATION:** Naples, FL, United States

**DATE OF APPLICATION:** August 2014

**MARKET:** Water & Wastewater

**TYPE:** New Construction

**OWNER:** Collier County

**PROJECT SIZE:** 50 Gallons

**AREA COATED:** Secondary Containment Equipment Pads

SUBSTRATE: Concrete

EXPOSURE: Exterior Weathering - severe industrial - seacoast and chemical environment

SURFACE PREP: Other

PRODUCTS: Plasite 130

### PROJECT DESCRIPTION:

Mitchell & Stark Construction was looking for a solution to be able to pour the equipment pads in the secondary containment structure and coat the tops of the pads in less than the typical 28 day cure time in order to begin installation of tanks and equipment.

### COATING SELECTION EXPLANATION:

Plasite 130 was added to the concrete for the equipment pads before being poured. This allowed the coatings to be applied to the top side of the pads within 48 hours providing the G.C. the ability to move forward with installation of equipment in the containment area 3 weeks sooner than the traditional 28 day cure time required. The balance of the containment coatings were applied once the equipment installation was complete.
